PRO

ANUI2172-AAU12446 represent novel human secretory and transmembrane PRO CC polypeptides. The PRO polypeptides are useful to detect other PRO CC polypeptides, to modulate biological activities of cells expressing PRO CC polypeptides, and to detect the presence of mammalian lung, colon, CC press, prostate, rectal, cervical or liver tumours by comparing PRO CC polypeptide expression in a cell sample to that in a control sample. Some CC polypeptide expression in a cell sample to that in a control sample. Some CC polypeptide expression in a cell sample to that in a control sample. Some CC polypeptide expression in a cell sample to that in a control sample. Some CC proliferation of condrocytes, the proliferation or gene expression in CC pericyte cells, the release of proteoglycans from cartilage, the CC proliferation of inner ear utricular supporting cells or of T-CC lymphocytes, the release of a cytokine from peripheral blood monocytes (C PBMCs), or the proliferation of endothelial cells. Some of the PRO CC polypeptides may modulate glucose or free fatty acid uptake by skeletal CC unsecle cells or by addipoytes; or inhibit binding of A-peptide to factor CC UIA. The PRO polypeptides can be used in assays to identify molecules crowled to binding interactions. The polymucleotides encoding PRO Some

The invention relates to an interleukin 20 (II-20) soluble receptor comprising two polypeptide subunits II-20RA (formerly known as ZcytoR7) and II-20RB (formerly known as DRRS1). The two subunits are preferably linked together. In one embodiment, one subunit is fused to the constant region of the light chain of an immunoglobulin, and the other subunit is fused to constant region of the heavy chain of an immunoglobulin. The light chain and the heavy chain are connected via a disulphide bond. The soluble receptor can be used to down-regulate II-20 and thus treat

The present sequence is human cytokine receptor protein, designated as CC GG92. GG92 is a member of the class II cytokine receptor (CRF2) family, CC which includes R1 and R2 of chains of the II-10 receptor (CRF2) family, CC alpha receptor complex, and tissue factor (TF). GG92 DNA and proteins are CC used in the prevention, diagnosis and treatment of diseases associated CC with inappropriate cytokine receptor expression such as inflammatory CC disorders and disorders of blood coagulation. These disorders include CC sepsis, thrombosis, acute pancreatitis, arthritis, vasculitis, lupus, CC immune complex glomerulonephittis, diabetes, allograft and xenograft CC transplantation, hepatitis, stroke and cancers. It is also used for CC trating various immune deficiencies and disorders such as severe CC combined immunodeficiency (SCID) and autoimmune disorders such as severe CC multiple sclerosis, rheumatoid arthritis; nervous system disorders (e.g., Albheimer's disease); sarcoidosis; leukaemias (e.g., erythroleukaemia); CC inflammations such as graft versus host disease (GVID), inflammatory bowel disease and endotoxin shock; hyperproliferative disorders (e.g., CC pooriasis); cancers (e.g., non-Hodgkin's lymphoma, prostate cancer) and componiesis reculation activity, immune regulating activity. Abamontatic contents in activity tissue growth activity bamontatic
                                                              haematopoiesis regulating activity, tissue growth activity, haemostatic and thromolytic activity, receptor/ligand activity and anti-inflammatory activity. CG92 is also used in assays to identify modulators of cytokine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polynucleotides encoding human cytokine receptor CG92, useful preventing, diagnosing and treating inflammation and disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 10; Fig 1-3; 109pp; English.

The invention relates to treating a mammal afflicted with a disease in which an interleukin-20 (IL-20) polypeptide plays a role, involves administering antagonist of IL-20 polypeptide to the individual. The method is useful for treating psoriasis, eczema, atopic dermatitis, contact dermatitis, adult respiratory disease, asthma, bronchitis and pneumonia and is also useful for treating multiple organ failure, inflammatory lung injury, septic shock, bacterial pneumonia, inflammatory bowel disease, rheumatoid arthritis, ulcerative colitis and Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 311 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating interleukin-20 induced inflammation in a mammal, such as adult respiratory disease, eczema, psoriasis, contact dermatitis, multiple organ failure and septic shock, involves administering IL-20 antagonist.

-I-FUNCTION: The IL20RA/IL20RB dimer is a receptor for IL19, IL20 : IL24. The IL22RA1/IL20RB dimer is a receptor for IL20 and IL24.
-I-SUBUNIT: Heterdimer with IL20RA and heterodimer with IL22RA1.
-I-SUBCELLULAR LOCATION: Type I membrane protein (By similarity).
-I-ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WIodawer A., Zdanov A.;

                                                                                                                                                                                                                             interferon receptor-related proteins CRF2-4 and IL-22R."
J Biol. Chem. 275:31335-31339 (2000).
I- FUNCTION: Receptor for IL10 and IL22. Serves as an a essential for the active IL10 receptor complex and to IL10-induced signal transduction events.
IL10-induced signal transduction events.
ISUBCELLULAR LOCATION: Type I membrane protein.
ISIMILARITY: Belongs to the type II cytokine family one in the supplementation of the supplementation.
ISIMILARITY: Contains 2 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Lutfalla G., MCInnie ....
